                                                                                                                                                                                                                                                                                                                                                                                                                                                     à
                                                                                                                                                                                                                                                                    The present invention relates to an isolated protein having L-galactose dehydrogenase (L-galDH) biological activity. L-galDH uncleic acid is useful for generating transgenic organisms and modified pants with enhanced ability to synthesise ascorbic acid. L-galDH facilitate the production of a plant that has been genetically modified to express a mutated L-galDH protein which is resistent to herbicides that act against the naturally occurring L-galDH and to identify and/or design compounds that are inhibitors of L-galDH and to identify and/or design compounds herbicide which acts on L-galDH and damages or kills plants that express the enzyme. The present sequence is Arabidopsis thaliana L-galactose dehydrogenase (L-galDH) The L-galDH gene is located on chromosome 4
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    120

             comprising an ascorbic acid precursor, thus forming ascorbic acid, and solating the ascorbic acid Also include are stabilising ascorbic acid or its salt in a medium comprising ascorbic acid or its salt and a recombinant yeast tinctionally transformed with a coding region encoding a protein having an enzyme activity selected from Legalactose debydrogenase (LGDH). Legalactono-1, 4 lactone oxidase (ABD). Legalnon-1, 4-lactone oxidase (ABD). Legalnon-1, 4-lactone oxidase (ABD) and aldonolactonase (ALD) activity, where the recombinant yeast is capable of converting to ascorbic acid at least about 25% ascorbic acid precursor or is capable of producing at least 20 mg ascorbic acid precursor. The sactor of produced (Vitamin C) is a powerful antioxidant, a deficiency of which causes scurvy in humans. The present sequence encodes

```

New isolated nucleic acid molecule that encodes a plant protein or its fragment, useful for isolating a variety of agronomically significant genes associated with plant growth, quality or yield, and as molecular tags to map genes.

Claim 1; SEQ ID NO 3555; 34pp; English.

The invention relates to 17880 cotton expressed sequence tags (ESTs;
ACN45220-ACN63099). The ESTs were isolated from cDNA libraries generated
from primed or non-primed seeds from variety DPSOB, mature seeds from
variety Coker 312 Boswell 96 Field, and androecium tissue, gynoecium
variety Coker 312 Boswell 96 Field, and androecium tissue, gynoecium
c variety Coker 312 Boswell 96 Field, and androecium tissue, gynoecium
c variety Coker 312 Boswell 96 Field, and androecium tissue, gynoecium
c variety Coker 312 Boswell 96 Field, and androecium tissue, groecium
c variety Coker 312 Boswell 96 Field, and septa from variety
c Nucotton33B. The invention also relates to substantiating an uncleic acid of the
c proteins or their fragments encoded by nucleic acid molecules of the
c comprising a nucleic acid of the invention. The cotton ESTs are useful as
c molecular tags to isolate genetic regions, to isolate genes to map to cused fouring a variety of agronomically significant genes are useful and ocloud also serve as
c used for isolating a variety of agronomically significant genes and catabolic pathways. The nucleic acid molecules are
c also useful for identifying genes important in initiating and maintaining
c seed germination or that may be used to mitigate stresses encountered
also useful for identifying genes in these tissues and/or other tissues,
c and also permits the acquisition of molecular mapping, and in cloning of agronomically
c schemes, genetic and molecular mapping, and in cloning of agronomically
c significant genes. The nucleic acid molecules are further useful for
detecting the expression level or pattern of a protein or mRNA and for
detecting the presence or quantity of a protein or mRNA and for
detecting the presence or guantity of a protein or mRNA
c present sequence represents a specifically claimed sequence
cotton variety DPSOB primed seed cDNA library (LIB3625). The sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     82
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   98
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      43 ArgGluAlaPheArgLeuGlyIleAsnPhePheAspThrSerProTyrTyrGlyGlyThr 62
                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABBS7377-ABB72072). The sequence data for this patent did not form part of printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       GECGECECETGTGCGAACTACGGTTTTGATTTGGAG---GAGGGTATTAAAACTGTG
